### Abstract

The purpose of the present study was to investigate the combined effect of SAQ training and yogic package on self confidence among handball players. To achieve the purpose of the study thirty men handball players were selected from Karaikudi, Tamilnadu, India during the year 2017. The subject's age ranges from 18 to 25 years. The selected subjects were divided into two equal groups consists of 15 players each namely experimental group and control group. The experimental group underwent a combined SAQ training and yogic package programme for six weeks. The control group was not taking part in any training during the course of the study. Self-confidence was taken as criterion variable in this study. The selected subjects were tested on Self-confidence was measured through the self-confidence inventory. Pre-test was taken before the training period and post- test was measured immediately after the six week training period. Statistical technique 't' ratio was used to analyse the means of the pre-test and post test data of experimental group and control group. The results revealed that there was a significant difference found on the criterion variable. The difference is found due to combined SAQ training and yogic package given to the experimental group on Self-confidence when compared to control group.

**Keywords:** combined saq training and yogic package, self-confidence and 't' ratio

### Introduction

The sports training can produce some physical fitness, Physiological and psychological benefits to the person and attain performance related task. It's also promoting the individual overall wealth to the sports person. Today, sports have become a part and parcel of our culture. It is being influenced and does influence all our social institutions including education, economics, arts, politics, law, mass communication and even international diplomacy (Alaguraja, K. *et.al*, 2019) [4]. Yoga is universally benefiting all people of all ages. The study of Yoga is fascinating to those with a philosophical mind and is defined as the silencing of the mind's activities which lead to complete realization of the intrinsic nature of the Supreme Being (Alaguraja, K. *et.al.*, 2017) [1]. In the sports world, physical education is the most essential aspect due to the fact physical schooling increases the performance and the effectiveness of the sports (Alaguraja, K. *et.al.*, 2018) [2].

Yoga is a system of exercises which helps the mind and body in order to achieve tranquillity and spiritual insight (Alaguraja, K. *et.al*, 2019) [5]. Make sure that when you practice yoga asanas, you don't just stretch the body because the mind has to be with the body. (Alaguraja, K. *et.al*, 2019) [8]. One can start practicing Yoga at any given moment of time and you may start with meditation or directly with pranayama without even doing the asanas (postures). (Alaguraja, K. *et.al*, 2019) [3]. Today's there is an escalating emphasis on appearing smarter, feeling etter and living longer. In order to achieve these ideals as, scientific evidence tells us that one of the keys is high fitness and exercises (Alaguraja, K. *et.al*, 2019) [7]. When consciousness is operating with the intellect and with all the senses, by making an individual

think that he or she is awake and aware, but the mind is actually less receptive and more critical (Yoga, P. *et. al.*, 2019) [10]. Yoga is a practical aid, not a religion and its techniques may be practiced by Buddhist, Jews, Christians, Muslims, Hindus and Atheist alike. Yoga is union for all (Selvakumar, K. *et.al*, 2019) [9].

### Research methodology

#### Selection of subjects

The purpose of the study was to find out the combined SAQ training and yogic package on Self confidence among men handball players. To achieve this purpose of the study, thirty men handball players were selected as subjects at random. The age of the subjects were ranged from 18 to 25 years.

#### Selection of variable

##### Independent variable

Combined SAQ training and yogic package

##### Dependent variable

Self confidence

#### Experimental design and implementation

The selected subjects were divided into two equal groups of fifteen subjects each, such as a combined SAQ training and yogic package group (Experimental Group) and control group. The experimental group underwent combined SAQ training and yogic package for six days per week for six weeks. Control group, which they did not undergo any special training programme apart

from their regular physical activities as per their curriculum. The following psychological variable namely Self-confidence was selected as criterion variable. All the subjects of two groups were tested on selected criterion variable Self-confidence was measured through the self-confidence inventory at prior to and immediately after the training programme.

**Statistical technique**

The ‘t’ test was used to analysis the significant differences, if any, difference between the groups respectively.

**Level of significance**

The 0.05 level of confidence was fixed to test the level of significance which was considered as an appropriate.

**Analysis of the data**

The significance of the difference among the means of the experimental group was found out by pre-test. The data were analysed and dependent ‘t’ test was used with 0.05 levels as confidence.

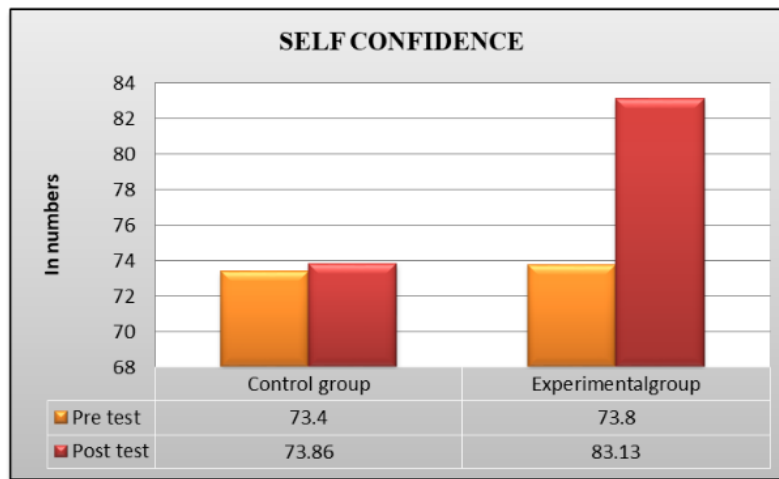

**Table I:** Analysis of t-ratio for the pre and post-tests of experimental and control group on Self-confidence (Scores in number)

Variables	Group	Mean		SD		df	‘t’ ratio
		Pre	Post	Pre	Post		
Self Confidence	Control	73.4	73.86	7.64	7.65	14	1.24
	Experimental	73.8	83.13	10.12	9.58		12.38*

\*Significance at .05 level of confidence.

The Table-I shows that the mean values of pre-test and post-test of the control group on Self-confidence were 73.4 and 73.86 respectively. The obtained ‘t’ ratio was 1.24, since the obtained ‘t’ ratio was less than the required table value of 2.14 for the significant at 0.05 level with 14 degrees of freedom it was found to be statistically insignificant. The mean values of pre-test and post-test of the experimental group on Self-confidence were 73.8 and 83.13 respectively. The obtained ‘t’ ratio was 12.38\* since

the obtained ‘t’ ratio was greater than the required table value of 2.14 for significance at 0.05 level with 14 degrees of freedom it was found to be statistically significant. The result of the study showed that there was a significant difference between control group and experimental group in Self-confidence. It may be concluded from the result of the study that experimental group improved in Self-confidence due to six weeks of combined SAQ training and yogic package.

**Fig 1:** Bar Diagram Showing the Pre and Post Mean Values of Experimental and Control Group on Self confidence

**Discussions on findings**

The result of the study indicates that the experimental group, namely combined SAQ training and yogic package group had significantly improved the selected dependent variable, namely Self-confidence, when compared to the control group. It is also found that the improvement caused by combined SAQ training and yogic package when compared to the control group.

**Conclusion**

On the basis of the results obtained the following conclusions are drawn,

1. There was a significant difference between experimental and control group on Self-confidence after the training period.
2. There was a significant improvement in Self-confidence. However the improvement was in favor of experimental

group due to six weeks of combined SAQ training and yogic package.
